

PCCAPS

Have been working with three high school seniors, and one junior, on projects for Rockwell Collins and Overstock.Com – as part of the PCAPS program, Park City, Utah. The CAPS concept is to link students with corporations and have them work on real projects that will build their professional skills, broaden their experience with hardware and software platforms, and push them into situations that need innovation and sheer hard work. The learning curve for some of the software is pretty steep – but the students are doing well. Next semester I'll have ten students and we have some interesting projects lined up including one for the USAF.
